

PR1/2 Demo

Christian Permann

Faculty of Computer Science, University of Vienna,
Währinger Straße 29, 1090 Vienna

11.12.2018

Milestones

- ▶ Basic tool with visualization of existing data. (PR1) (done)
- ▶ Enable running (ELKI) algorithms from the custom tool. (done)
- ▶ Properly save and display clustered data. (done, missing saving of results)
- ▶ Enable defining presets and running multiple clusterings. (done)
- ▶ Allow for parameter space exploration within results. (OPTICS)

The Tool

Demo

More Interfaces

```
public interface IClusterer {  
    JPanel getOptionsPanel();  
    String getName();  
    String getSettingsString();  
    List<ClusteringResult> cluster(Database db);  
    IClusterer duplicate();  
}
```

Figure 1: The interface for clustering algorithms

```
public interface IDistanceMeasure {  
    public String getName();  
    public double distanceBetween(ClusteringResult clustering, ClusteringResult clustering2);  
}
```

Figure 2: The interface for meta distance-measures

What we have

The good:

- ▶ OPTICS seems to work well, clusters represented in MDS plot.
- ▶ The chosen distance measures give quite similar looking results → validate each other.

The bad:

- ▶ Nothing can be saved yet. ELKI classes not serializable - object references when rebuilding from custom format?

The ugly:

- ▶ The colors are the same between selected clustering and meta-clustering.
- ▶ The colors are sometimes ugly when there are lots of clusters.
